A PROJECT REPORT

ON

EXAM MANAGEMENT SYSTEM

Submitted to
Department of Computer Application
Everest College, Thapathali

In partial fulfillment of the requirements for the Bachelor of Computer Application

Submitted by

Karuna Magar (35502104)

Avipsha Adhikari (35502102)

Under the Supervision of

Sunny Kumar Shah

Tribhuvan University

Faculty of Humanities and Social Sciences

Everest College, Thapathali

SUPERVISOR'S RECOMMENDATION

I hereby recommend that this project prepared under by supervision by Karuna (35502104) and Avipsha Adhikari (35502102) entitled "**Exam management system**" is satisfactory in partial fulfillment of the requirement for the degree of Bachelor in Computer Application (BCA) be processed for evaluation.

Name of the Supervisor:

Mr. Sunny Kumar Shah

Signature of the Supervisor

BCA 4th Semester, II-year
Department of Computer Application
Everest College, Thapathali

Tribhuvan University

Faculty of Humanities and Social Sciences

Everest College, Thapathali

LETTER OF APPROVAL

This is to certify that this project prepared by Karuna Magar and Avipsha Adhikari entitled "EXAM MANAGEMENT SYSTEM" in partial fulfillment of the requirements for the degree of Bachelor in Computer Application has been evaluated. In our opinion it is satisfactory in the scope and quality as a project for the required degree

SUPERVISOR Sunny Kumar Shah Contact no: 9844160731 Department of BCA Everest College	**HOD/CO-ORDINATOR** Mr. Kamal Pathak Contact no: 9845177327 Department of Computer Application Everest College, Thapathali
INTERNAL EXAMINER **Name:** Kamal Pathak **Date:**	**EXTERNAL EXAMINER** **Name:** **Date:**

ABSTRACT

The **Exam Management System** is a software application designed to manage and organize examination-related activities in an educational institution. The system helps students, teachers, and administrators perform their tasks efficiently through a centralized platform.

In this system, students can log in to view their exam schedule, room number, and examination results. Teachers are able to upload question papers, enter and update students' marks, and manage examination-related information. The administrator has full control of the system and can manage student and teacher records, verify their details, and approve their accounts to ensure authentic and secure login access. The system stores all examination data in a local database and works as an offline management system, reducing manual paperwork and minimizing errors in exam management. By automating processes such as exam scheduling, mark entry, and result generation, the system improves accuracy, security, and efficiency in handling examination activities within the institution.

ACKNOWLEDGEMENT

We would like to express our sincere gratitude to our respected supervisor for their valuable guidance, continuous support, and constructive suggestions throughout the development of this project entitled **"Exam Management System."** Their encouragement and insightful feedback greatly contributed to the successful completion of this work.

We are also thankful to our college for providing us with the opportunity and necessary resources to undertake and complete this project. The knowledge and skills gained during our academic studies played an important role in the development of this system.

Furthermore, we would like to acknowledge the cooperation and support of our friends and classmates who provided helpful suggestions and assistance during the course of this project. We are truly grateful to everyone who directly or indirectly contributed to the successful completion of this project.

CHAPTER:1 PROJECT INTRODUCTION

1.1 Introduction

Examinations play a very important role in the academic system of every educational institution. They are used to evaluate the knowledge, skills, and academic performance of students. In many institutions, examination-related activities such as preparing exam schedules, assigning examination rooms, maintaining student records, entering marks, and publishing results are often managed manually. This traditional method requires a significant amount of time and effort and may lead to errors or difficulties in managing large amounts of data.

The **Exam Management System** is developed to provide a more efficient and organized way of managing examination-related activities. This system is designed as an offline application that helps in maintaining and processing examination information using a computerized system and a local database.

Through this system, students can log in to view their examination schedule, assigned room numbers, and results. Teachers are able to upload examination questions and enter or update students' marks after the examinations. The administrator is responsible for managing the records of students and teachers, verifying their information, and approving their accounts to ensure secure and authenticated access to the system.

The development of this system aims to reduce manual work, improve accuracy in record management, and make the examination process more systematic, reliable, and efficient within the institution.

1.2 Problem Statement

The traditional method of managing examination activities in educational institutions often relies on manual processes. This creates several challenges in maintaining and managing examination information effectively. The major problems are as follows:

1. Managing examination schedules, room assignments, and records manually requires a significant amount of time and effort.
2. Manual handling of data increases the possibility of errors in student records, marks entry, and result preparation.
3. Students may face difficulty in obtaining timely information about their exam schedules, room numbers, and results.
4. Teachers may find it inconvenient to manage question papers and record students' marks using traditional methods.
5. Administrators may face challenges in maintaining organized records and ensuring proper authentication of student and teacher accounts.

Therefore, there is a need for a computerized **Exam Management System** that can efficiently manage examination activities and provide accurate and organized information to students, teachers, and administrators.

1.3 Objectives

The main objectives of the **Exam Management System** are as follows:

1. To develop a computerized system for managing examination-related activities efficiently.
2. To provide students with access to examination information, such as exam schedules, room numbers, and results.

3. To enable teachers to upload question papers and manage students' marks in an organized and systematic manner.
4. To allow the administrator to manage and verify student and teacher **r**ecords and approve their authenticated login.
5. To reduce manual workload and improve accuracy in managing examination data and records.

1.3 Scope and Limitations

Scope

1. Students can view exam schedule, room number, and results.
2. Teachers can upload questions and add students' marks.
3. Admin can manage student and teacher records.
4. Admin can approve authenticated login for users.
5. The system helps organize and manage exam data efficiently.

Limitations

1. The system works only offline.
2. Access is limited to authorized users.
3. Data is stored locally, so backup is required.
4. The system supports only basic exam management functions.
5. Technical maintenance may be required.

1.4 Report Organization

This report is organized into five chapters that describe the development of the Exam Management System.

Chapter 1: Project Introduction

This chapter presents the introduction of the project, including the problem statement, objectives, scope and limitations, and the overall organization of the report.

Chapter 2: Background Study and Literature Review

This chapter discusses the background information related to the system, reviews related literature, and explains the proposed system.

Chapter 3: System Analysis and Design

This chapter describes the system analysis including requirement analysis, feasibility analysis, and process modeling. It also explains the system design such as architectural design, database schema design, and interface design

Chapter 4: Implementation and Testing

This chapter explains the implementation of the system, including the technologies used, development process, and testing of the system to ensure proper functionality.

Chapter 5: Conclusion and Future Recommendations

This chapter summarizes the overall project and provides suggestions for future improvements and enhancements of the system.

CHAPTER 2: BACKGROUND STUDY AND LITERATURE REVIEW

2.1 Background Study

Examinations are an essential part of the academic system in educational institutions. They are conducted to evaluate students' knowledge, understanding, and academic performance in different subjects [2]. Managing examinations involves several activities such as preparing exam schedules, assigning examination rooms, maintaining student records, conducting exams, recording marks, and publishing results.

In many institutions, these activities are traditionally managed using manual methods or simple record-keeping systems. Such methods require a significant amount of time and effort and may lead to errors in data management [1]. As the number of students and courses increases, managing examination information manually becomes more complex and difficult.

With the advancement of information technology, computerized systems have been developed to simplify and improve the management of examination processes [2]. An Exam Management System helps institutions organize examination data efficiently, reduce manual workload, and improve accuracy in record management.

The system provides different functionalities for students, teachers, and administrators. Students can access information such as exam schedules, room numbers, and results. Teachers can upload question papers and record students' marks, while administrators can manage user records and control authenticated access to the system. Therefore, the use of an Exam Management System helps institutions manage examination activities in a more systematic and efficient manner [3].

2.2 Literature Review

The development of examination management systems has been an important topic in educational technology. Many researchers and developers have focused on designing computerized systems to simplify and improve the management of examination-related activities in educational institutions.

Several studies highlight that traditional manual examination systems are time-consuming, inefficient, and prone to human errors [1], [2]. Managing large amounts of student data, examination schedules, marks, and results manually can create difficulties in maintaining accurate and organized records.

Different examination management systems have been developed to address these challenges by using computerized databases and software applications. These systems help automate tasks such as student registration, exam scheduling, question management, marks entry, and result generation [4]. As a result, they improve the efficiency, accuracy, and reliability of examination processes.

Previous systems also emphasize the importance of secure user authentication, where administrators, teachers, and students are provided with different access rights. This helps ensure that examination data is properly managed and accessed only by authorized users [2].

Based on these studies and existing systems, the proposed Exam Management System aims to provide a simple and efficient platform where administrators can manage user records, teachers can upload questions and enter marks, and students can easily access exam schedules, room numbers, and results.

2.3 Proposed System

The proposed **Exam Management System** includes the following features:

1. Provides a computerized offline system for managing examination activities.
2. Allows students to view exam schedule, room number, notices, and results.
3. Enables teachers to upload question papers and enter students' marks.
4. Allows the administrator to manage student and teacher records.
5. Provides authentication and approval of user login by the admin.
6. Enables the admin to publish notices and generate reports.
7. Stores all data in a local database for fast and secure access.
8. Reduces manual work and improves accuracy and efficiency.

CHAPTER 3: SYSTEM ANALYSIS AND DESIGN

3.1 System Analysis

System analysis is the process of examining and understanding the requirements of the proposed Exam Management System. It identifies the different types of users, their roles, and the data required for the system. The Software Development Life Cycle (SDLC) is used to structure and organize the development process [2].

Software Development Life Cycle

The Software Development Life Cycle (SDLC) is a structured framework used to plan, develop, test, and maintain a software system. It provides a systematic approach to ensure that the system meets user requirements and is delivered efficiently and reliably [1].

The **Waterfall Model** is the most suitable methodology for developing the **Exam Management System** because it is simple, linear, and easy to implement for projects with clearly defined requirements.

Waterfall Model

The Waterfall Model is a traditional software development methodology in which the development process flows sequentially through predefined phases. Each phase must be completed before the next begins, making it simple, structured, and easy to manage [5].

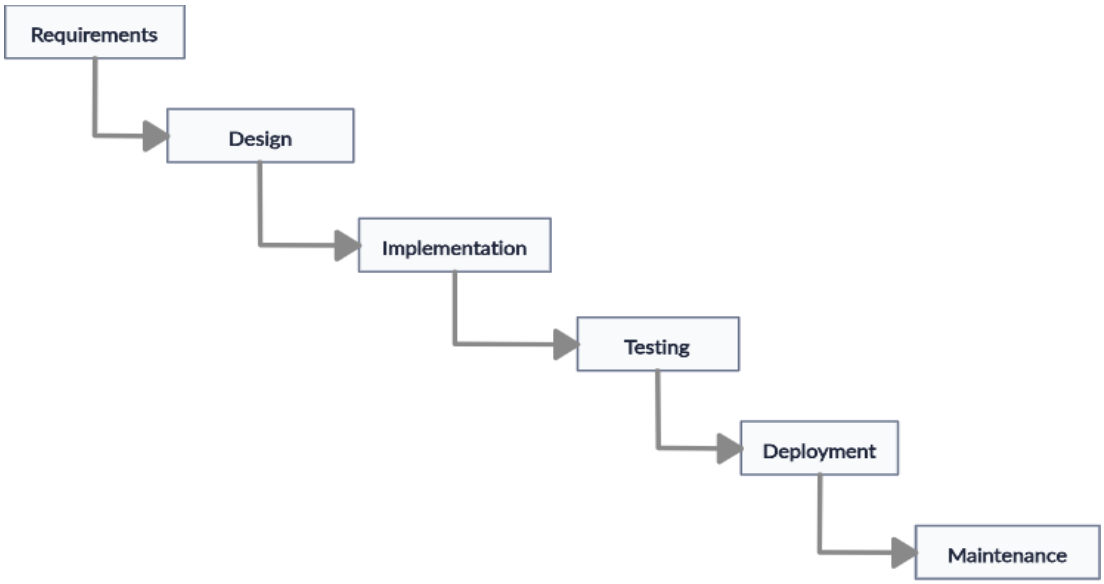

Fig 3.1:- Waterfall Model of Student Management System

Phases of the Waterfall Model:

1. **Requirement Analysis** – Collecting and analyzing the system requirements from students, teachers, and administrators.
2. **System Design** – Designing the architecture, database, and interfaces based on the requirements.
3. **Implementation (Coding)** – Developing the system using programming languages and tools.
4. **Testing** – Verifying and validating the system to ensure it meets the requirements and is error-free.
5. **Deployment** – Installing the system for actual use in the institution.
6. **Maintenance** – Performing updates, fixing issues, and making improvements as needed.

3.1.1 Requirement Analysis

Requirement analysis is the process of identifying and defining the needs and functionalities of the proposed **Exam Management System**. It ensures that the system meets the expectations of students, teachers, and administrators.

A. **Functional Requirements:**

1. Students can log in to view exam schedules, room numbers, notices, and results.
2. Teachers can log in, upload question papers, and enter or update students' marks.
3. Administrators can manage student and teacher records, approve user accounts, and provide notices.
4. Secure login authentication for all users.
5. The system can generate reports on exams, results, and user activity.

Use Case Diagram

Use Case Diagram is part of UML (Unified Modeling Language) and is used to

visually represent the functional requirements of a system. It shows:

1. **Actors** – The users or roles interacting with the system (e.g., Student, Teacher, Admin).
2. **Use Cases** – The actions or services the system provides (e.g., Login, View Exam Schedule, Enter Marks).
3. **Relationships** – How actors interact with these use cases (simple lines, includes, extends).

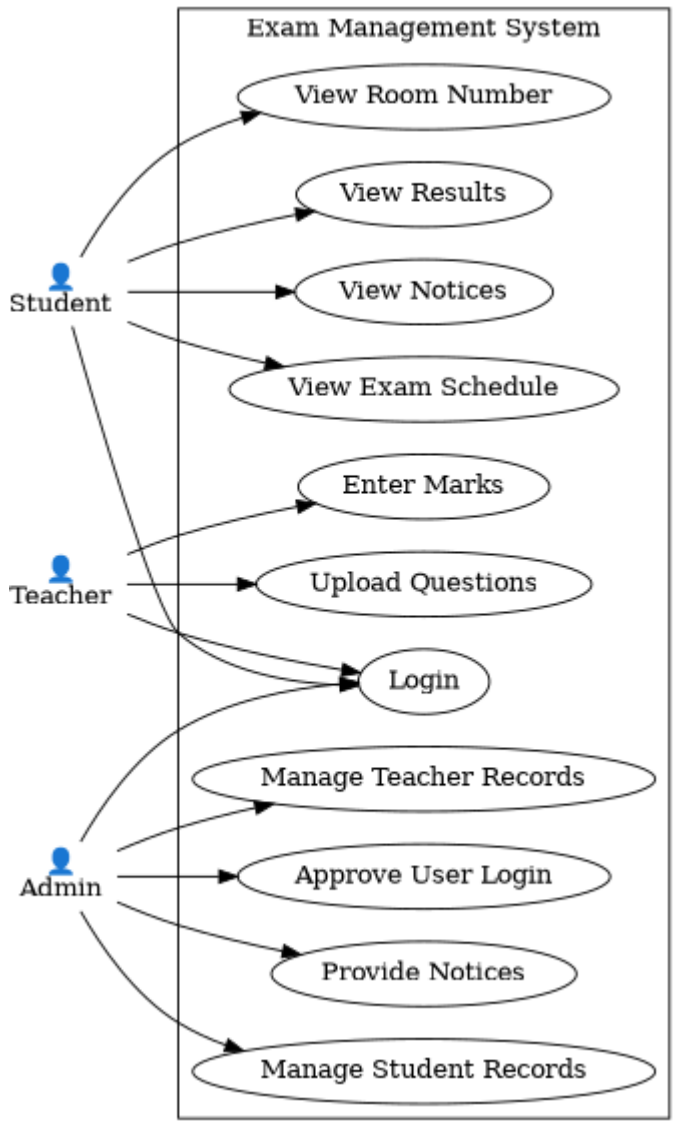

Fig 3.2:- Use case Diagram of Exam Management System

B. Non-Functional Requirement

Non-functional requirements define the **quality attributes, constraints, and performance criteria** of the system rather than specific behaviors. They ensure the system is reliable, efficient, and user-friendly.

For the **Exam Management System**, the key non-functional requirements are:

1. **Performance:** The system should respond quickly to user actions, retrieving data such as exam schedules and results efficiently.
2. **Usability:** The interface should be simple and easy to navigate for students, teachers, and admin.
3. **Security:** All data, including student records, exam results, and teacher uploads, must be protected against unauthorized access.
4. **Reliability:** The system should operate without crashes or errors during normal usage.
5. **Maintainability:** The system should be easy to update and modify for future improvements.
6. **Offline Functionality:** The system should operate without requiring an internet connection.
7. **Data Integrity:** All stored information should remain accurate and consistent across the system.

3.1.2 Feasibility Analysis

Feasibility analysis evaluates whether the proposed system is practical and achievable within available resources, time, and technical constraints. It helps determine whether the system should be developed or not based on different factors such as technical, economic, operational, and schedule feasibility [1].

1. **Technical Feasibility:**
    - The system will be developed using offline technologies such as Java, MySQL, or a local database.
    - Existing hardware and software in the institution are sufficient to support the system.
    - The development team has the required technical skills.
2. **Economic Feasibility:**
    - The project requires minimal cost since it uses offline tools and existing infrastructure.
    - Development and maintenance costs are low, making it a cost- effective solution for the institution.

3. **Operational Feasibility:**
    - The system is easy to use and fits into the daily operations of students, teachers, and administrators.
    - Training requirements are minimal because of the simple user interface and straightforward functionality.
4. **Schedule Feasibility:**
    - The system can be developed within the academic project timeframe without delays.
    - All functionalities can be implemented in the planned duration.

Gantt Chart

A **Gantt Chart** is a visual tool used in project management to **plan, schedule, and track tasks over time**. It shows the start and end dates of each activity and helps the team see the overall project timeline at a glance.

Main purposes of using a Gantt Chart in the Exam Management System project:

1. **Task Planning:** Helps break down the project into smaller tasks and assign timelines.
2. **Time Management:** Ensures each phase of the project (analysis, design, coding, testing, deployment) is completed on schedule.
3. **Progress Tracking:** Allows monitoring of task completion and identifies delays early.
4. **Resource Management:** Helps allocate resources efficiently and avoid overlaps.
5. **Visualization:** Provides a clear graphical view of the project flow for students, teachers, and evaluators.

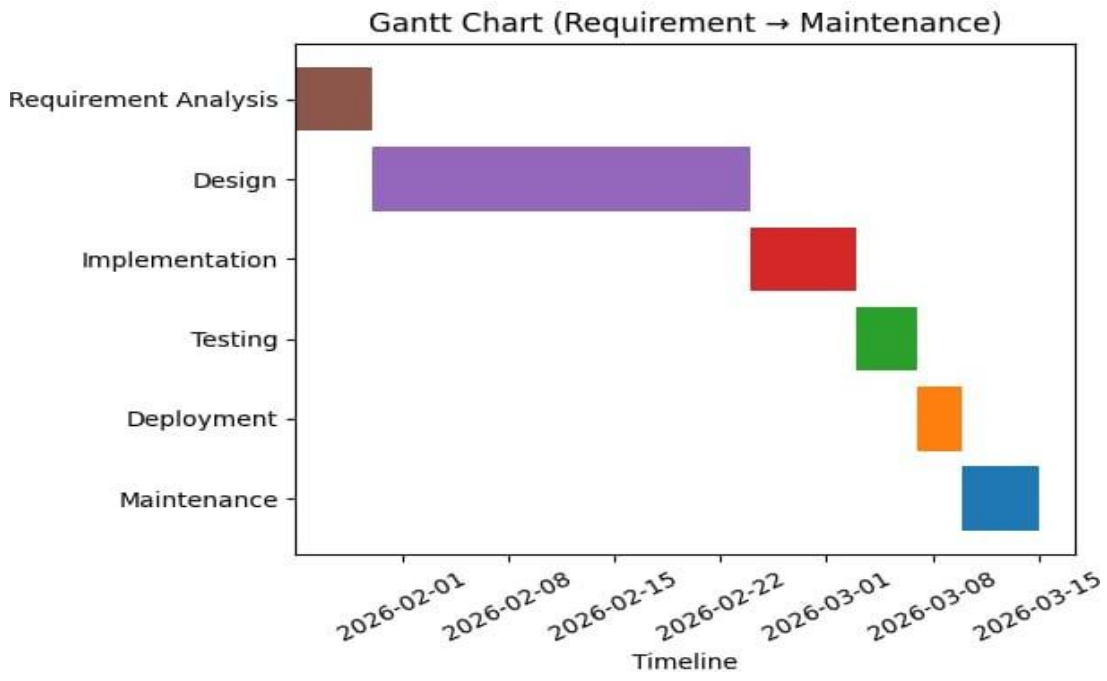

Fig 3.3:- Gantt Chart

The Gantt chart represents the complete timeline of the project from January 25 to March 15, showing each phase in a sequential order where one task begins after the previous one is completed. The project starts with requirement analysis, where user needs are gathered, followed by the design phase, which takes the longest time as the system structure and planning are developed. After that, implementation is carried out to build the system through coding, and then testing is done to identify and fix errors. Once the system is verified, it is deployed for use, and finally, a maintenance phase of five days is added at the end to handle updates, bug fixes, and support after deployment. This chart clearly shows the duration and flow of each activity, helping in effective project planning and management.

3.1.3 Data Modeling

Entity Relationship Diagram(ERD)

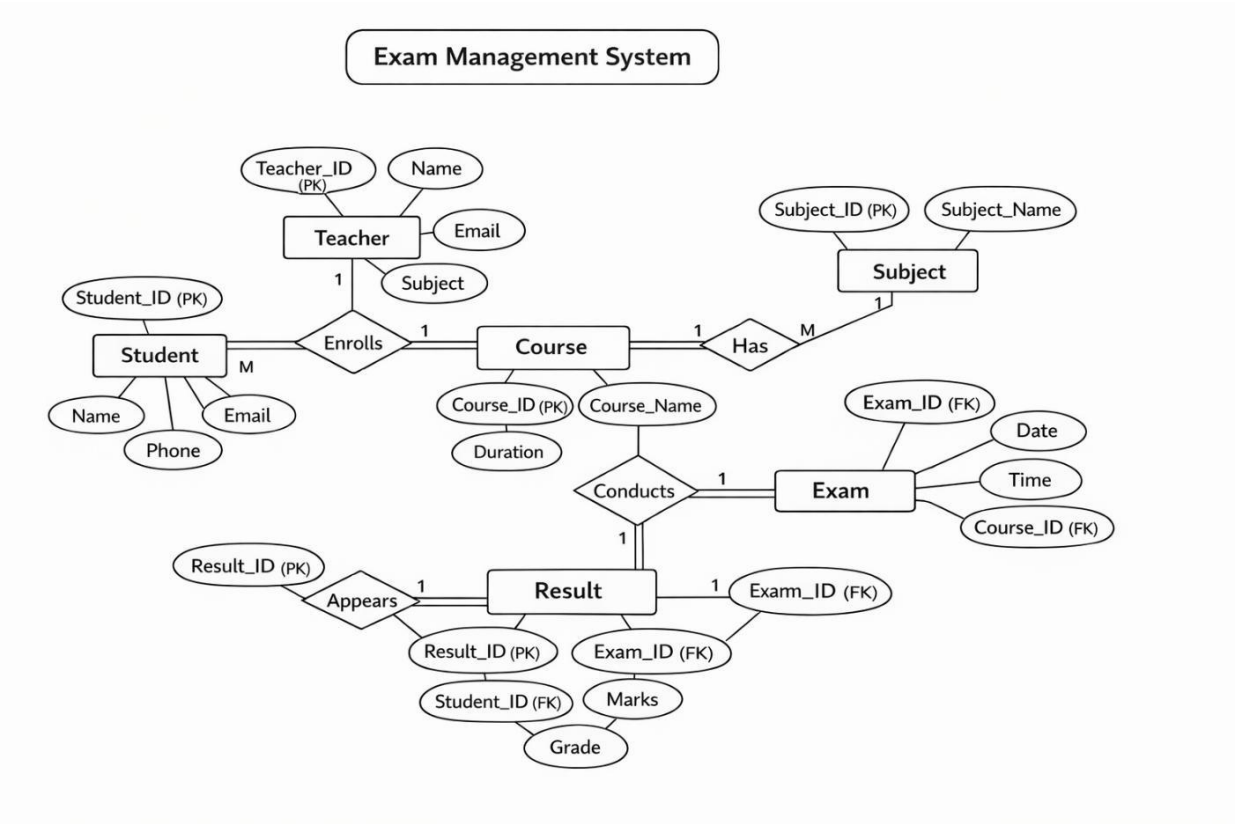

Fig 3.4:- ER- Diagram of Student Management System

The Entity-Relationship (ER) model is a conceptual data model used to represent the structure of a database. It defines entities, attributes, and relationships in a graphical form known as an ER diagram.

3.1.4 Process Modelling

Data Flow Diagram (DFD)

A Data Flow Diagram (DFD) is a graphical representation used to illustrate the flow of data within a system. It shows how data is input, processed, stored, and output through different components of the system [6].

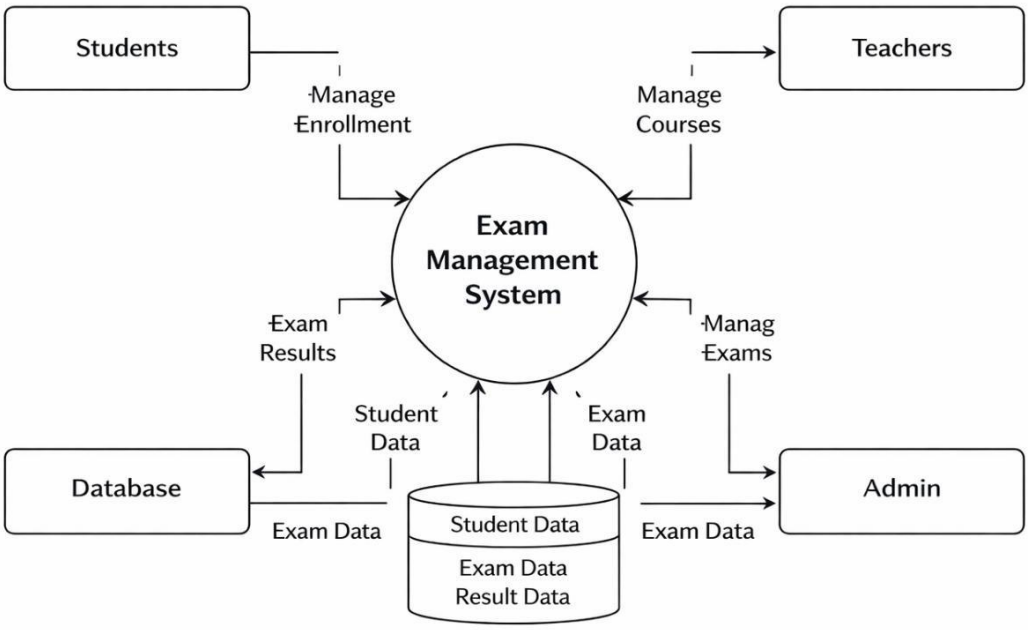

Fig3.5: Context Architecture of Exam Management System

3.2 System Design

The design phase translates the requirements into a detailed plan for implementation

3.2.1 Architecture Design

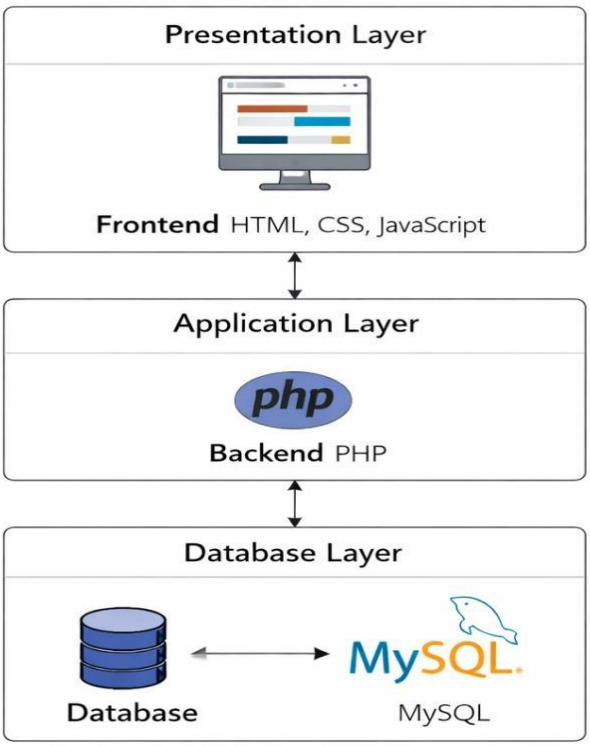

Fig3.6:- Architecture Design of Exam Management System

The system is designed using a **three-tier architecture**, which separates the application into three layers: Presentation Layer, Application Layer, and Database Layer. Each layer has specific tasks and responsibilities.

1. **Presentation Layer (Frontend)**

   Technologies: HTML, CSS, JavaScript

   Tasks:

   - Provides the **user interface** for students, teachers, and admin.
   - Displays information such as exam schedules, results, notices, and forms.
   - Takes user input (login details, marks entry, etc.).
   - Sends requests to the backend and shows responses to users.
   - Ensures the system is **user-friendly and interactive**.

2. **Application Layer (Backend)**

   Technology: PHP

Tasks:

- Acts as the **logic layer** of the system.
- Processes user requests received from the frontend.
- Performs operations such as login authentication, data validation, and calculations.
- Controls system functionalities like uploading questions, entering marks, and managing users.
- Communicates between the frontend and database.

3.Database Layer

Technology: MySQL

Tasks:

- Stores all system data such as student records, teacher data, exam schedules, and results.
- Retrieves data when requested by the backend.
- Ensures **data consistency, security, and integrity**.
- Handles operations like insert, update, delete, and fetch data.

3.2.2 Database Schema Design

3.2.3 Interface Design

Interface design refers to the development of user-friendly screens through which users interact with the system. It focuses on creating simple, clear, and efficient interfaces for students, teachers, and the admin.

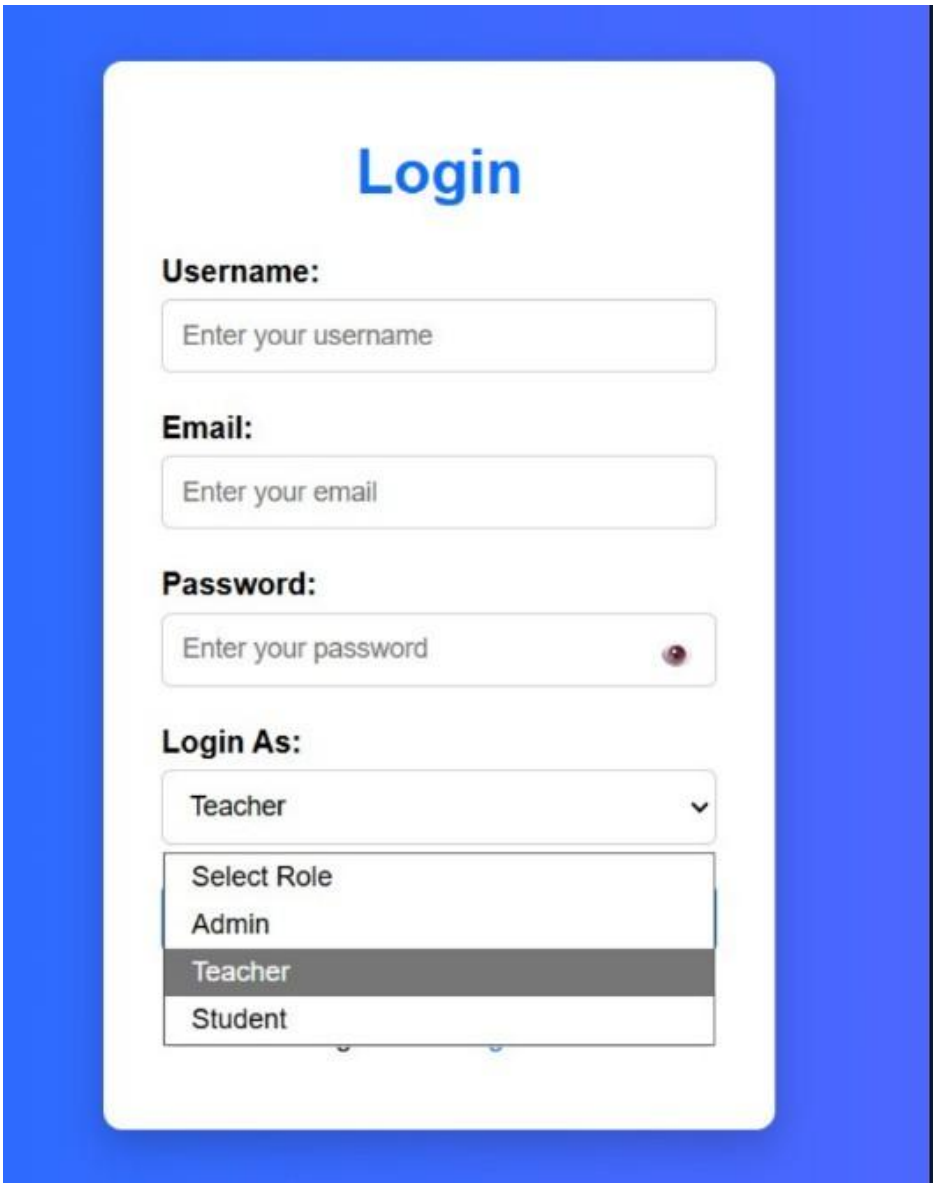

Fig 3.7:- Users Login Page

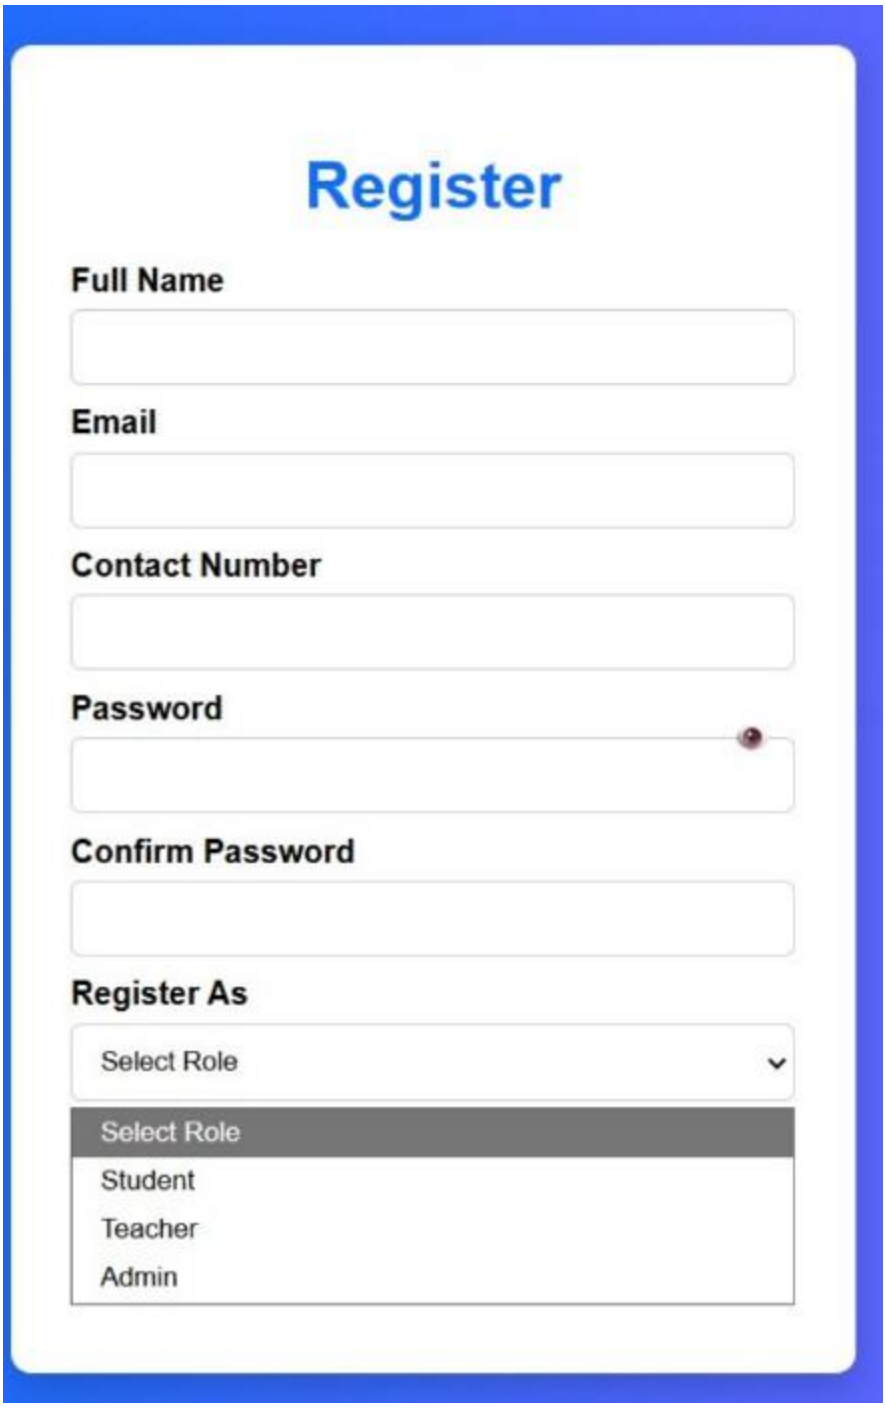

Fig 3.8:- Users Register Page

CHAPTER 4: IMPLEMENTATION AND TESTING

4.1 Implementation

In this project, we use different modern technology to build the Exam Management System. HTML is used to structure web pages, and CSS is used for designing the layout **[8]**. JavaScript is used for client-side validation and interactivity **[9]**. PHP is used as a backend language to process user requests and connect with the database **[8]**. Together, these tools helped us create a system that is both functional and enjoyable to use.

4.1.1 Tools Used

I. Case Tool

Following CASE tools were used during the development of the system.

- **Diagram Tools**

a) draw.io: Draw.io, also known as diagrams.net, was used to create the ER diagram, data flow diagram, use case diagram, wireframes, and database schema for the Student Management System project.

- **Version Control Tools**

a) GitHub: GitLab was used as version control tool for the development of the project.

- **Integrated Development Environment**

a) Visual Studio Code: Our primary environment for writing, debugging, and testing code

II. Programming Tools

- **Frontend**

a) **HTML** – to create the structure of web pages

b) **CSS** – to design and make the pages look good

c) **JavaScript** – to add basic functions like form validation

- **Backend**

a) **PHP** -Handle user requests

-Process data

-Connect frontend with database

III. Database Platforms

a) **MySQL**- stores all the data of students,teachers and admin.

4.1.2 Implementation Details of Modules

1. Student Module

The **Student Module** allows students to register and log in to the system. It enables them to view exam schedules, download admit cards, and check their results. This module ensures that students can access all exam-related information easily.

2. Administrator Module

The **Administrator Module** manages the overall system. The administrator can add, update, or delete student records, create exam schedules, and generate reports. This module ensures smooth system management and proper control over exam operations.

3. Examiner / Faculty Module

The **Examiner Module** allows faculty or examiners to enter and update marks for students. They can evaluate student performance and submit final evaluations to the system. This module ensures accurate recording of student performance.

4. Exam Scheduling Module

The **Exam Scheduling Module** handles the planning of all exams. It manages scheduling exams, assigning examiners, and publishing timetables. This module ensures that exams are conducted on time and without conflicts.

5. Result Processing Module

The **Result Processing Module** calculates total marks, assigns grades, and generates final result reports. This module ensures that student performance is evaluated accurately and results are made available efficiently.

4.2 Testing

Unit testing is performed to ensure that each individual component or module of a system works correctly before integrating it with other parts. It helps developers identify and fix errors at an early stage of development.

4.2.1 Test Cases for Unit Testing

Test Case	**Input**	**Expected Result**	**Test Result**
Successful User Registration	Username=User Email=user@gmail.com Password=1234 Phone=9800123456	"Register Successful" message should be displayed	Successed Message is display
Register with empty fields	Missing required fields	Error message displayed	A message" Error
Registration Fail of already exist email	Username=User Email=user@gmail.com Password=1234 Phone=9800123456	User Email already exit	Username already exists message

Table 4.1:- Test case of User Registration

Test Case	Input	Expected Result	Test Result
Admin login with valid credentials	Username=admin Password=admin	Correct username and password	Successful login of admin
Admin login with invalid credentials	Username=admin Password=admin	Wrong username/password	Error message displayed
Logout functionality	Click logout option	Admin logged out successfully	The page redirect to homepage.

Table4.2:- Test Case of Admin login and Logout

Test Case	Input	Expected Results	Test Result
Student login with valid credentials	Username=student Password=student	Correct username and password	Successful login of student.
Student login with invalid credentials	Username=student Password=student	Wrong username/password	Error message displayed
Logout functionality	Click logout option	Student logged out successfully	The page redirect to homepage.

Table 4.3:- Test Case for Student Login and Logout

Test case	**Input**	**Expected Results**	**Test Result**
Student login with valid credentials	Username=teacher Password=teacher	Correct username and password	Successful login of teacher.
Student login with invalid credentials	Username=teacher Password=teacher	Wrong username/password	Error message displayed
Logout functionality	Click logout option	Teacher logged out successfully	The page redirect to homepage.

Table 4.4:- Test case of Student Login and Logout

Test Case	Input	Expected Results	Test Result
Successful Question update	Change or upload change questions	A message "question update successful" should displayed	"Question update successful" displayed

Test 4.5:- Test case of questions Update

Test Case	Input	Expected Results	Test Result
Successful marks edited	Upload change marks	A message “mark edited successful” should displayed	A new marks is update

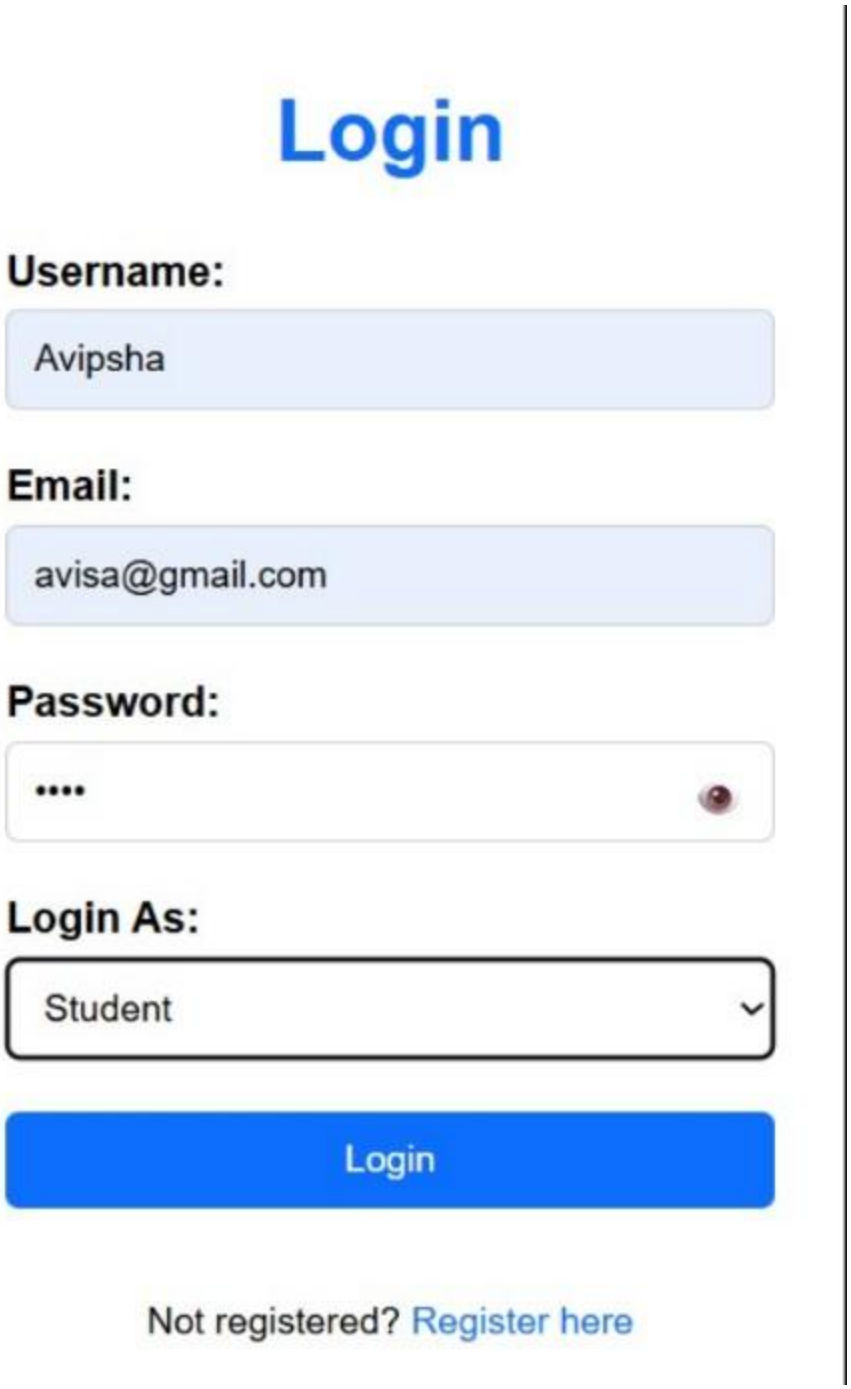

Fig 4.4:- login with valid credintials

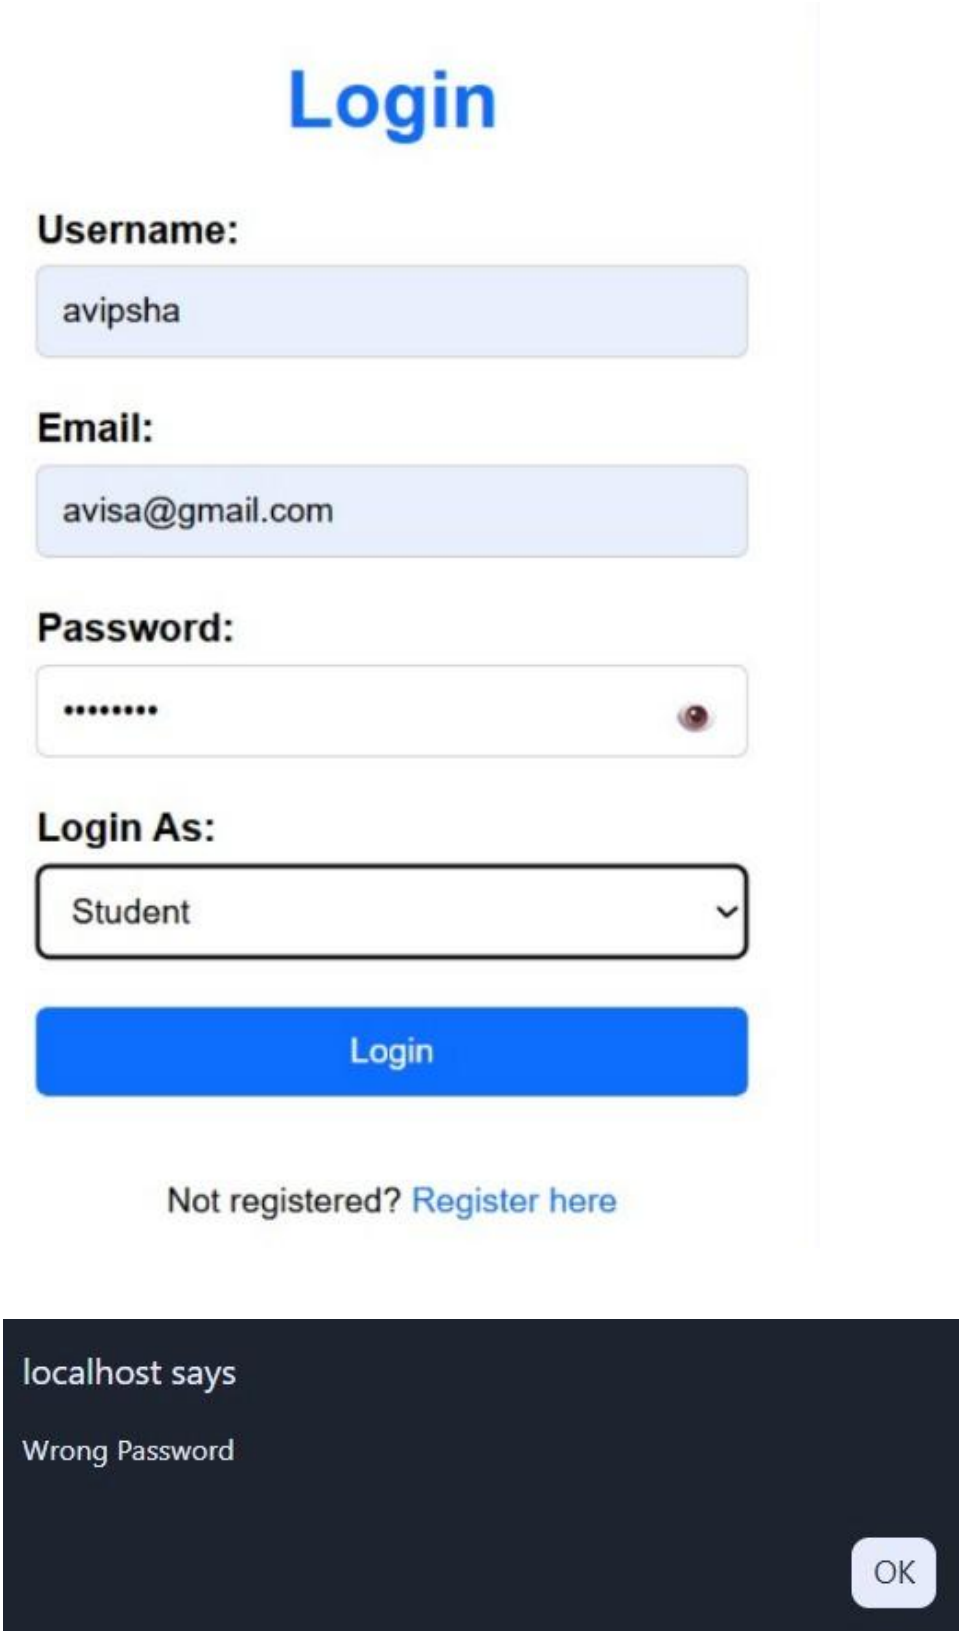

Fig 4.5:- Login with wrong password

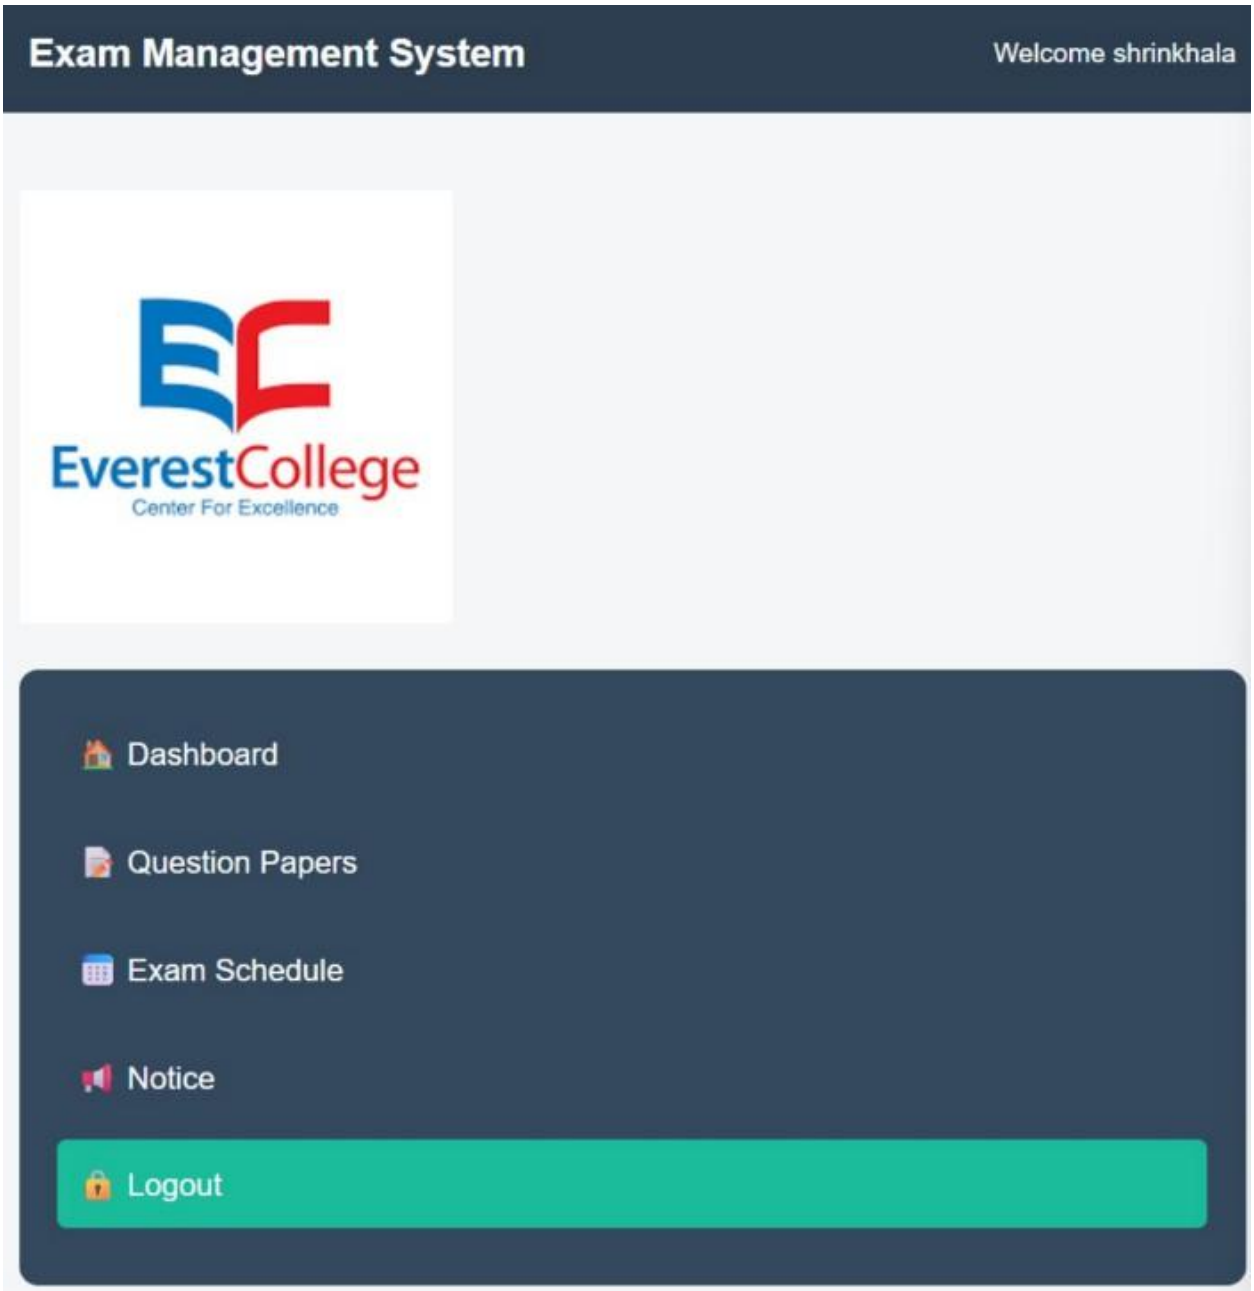

Fig 4.6:- Log out of the dashboard

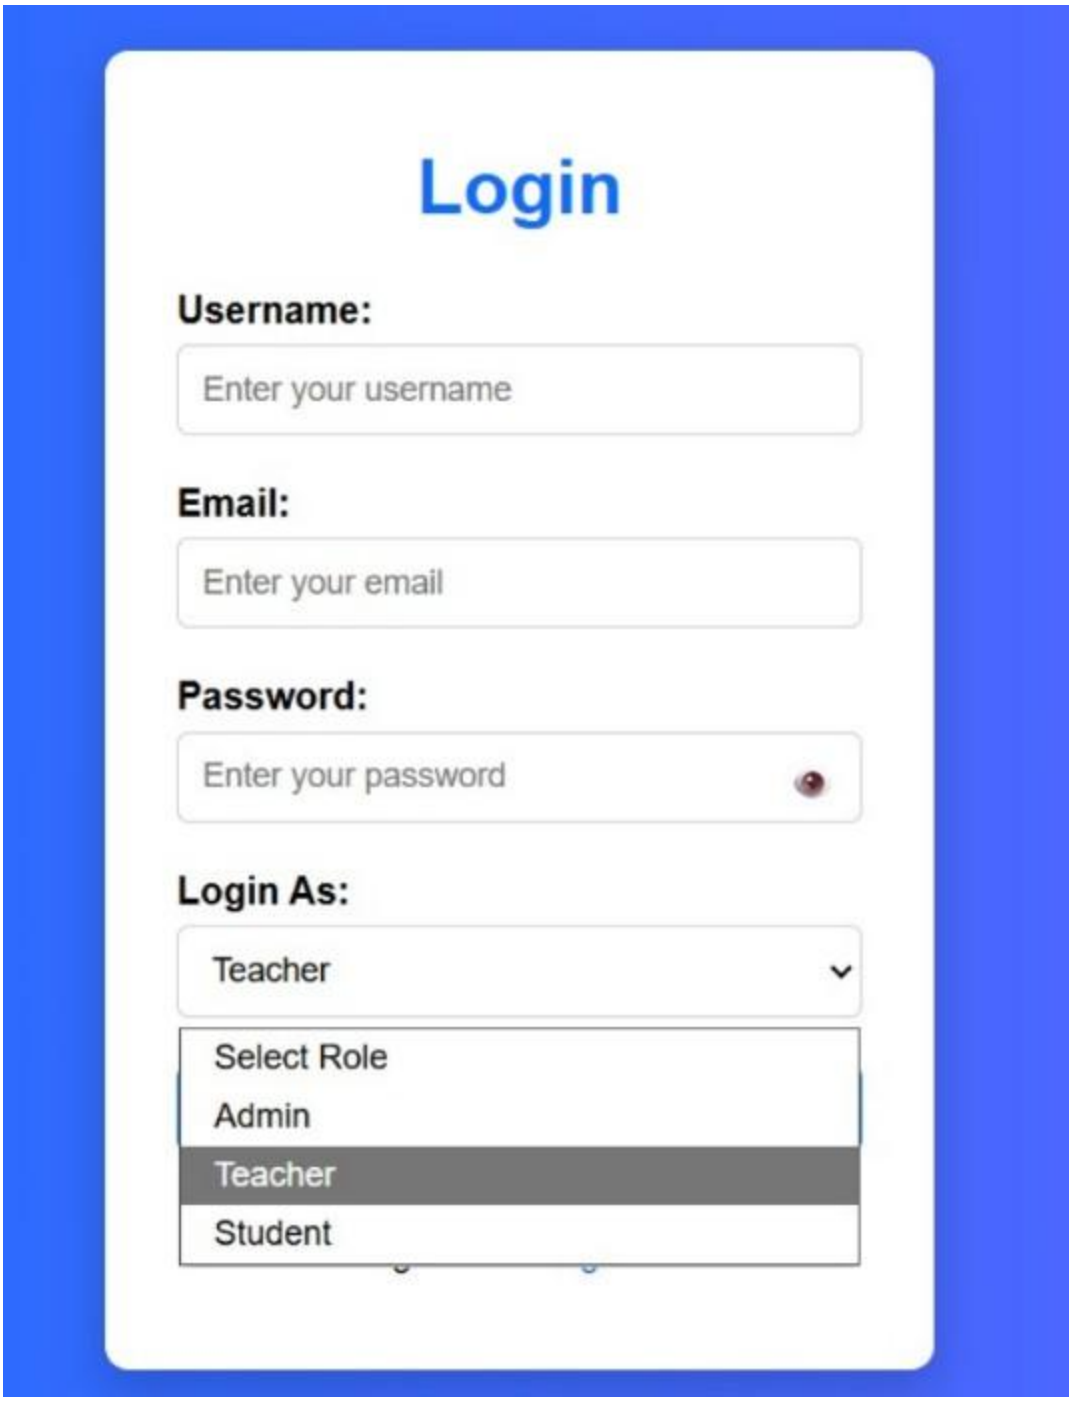

Fig 4.7:- After log out back to login page

4.2.2 Test cases for System Testing

System testing test cases are designed to verify that the entire **Exam Management System** works correctly as a complete system. These test cases check all major functionalities such as login, student activities, teacher operations, and admin controls.

The system is tested by validating user login with both correct and incorrect credentials. It ensures that students can view exam schedules, room numbers, and results accurately. Teachers are tested for uploading question papers and entering marks correctly. Similarly, the admin functionalities such as managing student and teacher records, approving user authentication, and providing notices are verified.

Additionally, the system is tested to ensure it works properly in an offline environment without any errors. These test cases help in identifying issues, improving system performance, and ensuring that the system is reliable and ready for deployment.

CHAPTER 5: CONCLUSION AND FUTURE RECOMMENDATION

5.1 Conclusion

The **Exam Management System** is an efficient and user-friendly offline application developed to manage and streamline all examination-related activities in an educational institution. It provides students with easy access to exam schedules, room numbers, notices, and results, while teachers can upload question papers and enter student marks accurately. The admin is empowered to manage student and teacher records, approve logins, and communicate important notices, ensuring smooth administration of the system.

The system reduces the dependency on manual processes, minimizes errors, and improves the overall accuracy and reliability of exam management. Its offline functionality ensures that operations can continue even without an internet connection. By following the **Software Development Life Cycle (SDLC)**, the project was developed systematically with proper planning, analysis, design, implementation, and testing.

Overall, the system demonstrates how automation can simplify academic processes, save time, enhance efficiency, and provide a secure, maintainable, and scalable solution for future use in educational institutions. It serves as a practical tool for both users and administrators, improving productivity and organization in exam management.

5.2 Future Recommendation

The **Exam Management System** can be further enhanced and expanded in the future to make it more efficient, flexible, and user-friendly. Some possible recommendations include:

1. **Online Functionality:** Integrating online access so students and teachers can access the system remotely, allowing real-time updates of schedules, marks, and notices.
2. **Mobile Application:** Developing a mobile app version of the system to provide students and teachers with easier access from smartphones or tablets.
3. **Automated Notifications:** Adding email or SMS notifications to alert students about upcoming exams, results, or important notices.
4. **Enhanced Security:** Implementing advanced security measures such as multi-factor authentication, encryption of sensitive data, and secure backup systems.
5. **Advanced Reporting:** Adding more analytical features, such as performance reports, statistics on student results, and teacher performance metrics.
6. **Integration with Other Systems:** Connecting the exam system with library, attendance, and academic management systems for a unified educational platform.
7. **Cloud-Based Storage:** Using cloud storage for better data reliability, scalability, and disaster recovery, even while maintaining offline access when needed.
